

# THE 411 ON COVID-19 VACCINES

VaccINATION

Partnership to Fight Infectious Disease

As we reach a significant milestone in the fight against COVID-19 - distribution of safe and effective vaccines - the Partnership to Fight Infectious Disease and VaccINATION are working to ensure that individuals can get the latest information about availability and access.

## 1 Vaccines have conquered disease over time.

Wide use of vaccines has helped us virtually eliminate many diseases like whooping cough, polio, measles, rubella, and more. But because these diseases aren't entirely eradicated, we must continue to vaccinate in order to eliminate opportunities for spread.

Measles

## 2 Vaccines made available to the public are safe and effective.

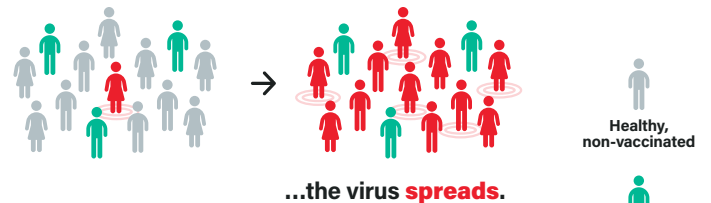

Vaccines are evaluated in clinical trials with thousands of study participants in order to generate enough scientific data to meet the FDA's strict requirements for safety and effectiveness. Experts agree that we can feel confident that vaccines have met the United States' extremely high standards for quality and safety. After approval, vaccines continue to be studied and monitored.

## 3 Vaccinating America against COVID-19 is the best way to end the pandemic.

If only **SOME** get vaccinated...

If **MOST** get vaccinated...

To stop this pandemic and get back to normal, we must use every tool available to us. Social distancing, mask-wearing, and frequent hand washing are known to help prevent the spread of COVID-19, but these measures alone are not enough. **Safe and effective vaccines are critical step forward to protect ourselves, our loved ones, and our communities.**
